Education

University of Maryland, College Park — Aug 2022 - May 2024
Master of Engineering in Robotics — GPA: 3.48/4.00

NMIMS University, India — Aug 2018 - May 2022
Bachelor of Technology in Mechatronics — GPA: 3.65/4.00

Experience

Robotics Algorithms & Autonomous Systems Lab, University of Maryland — March 2024 - Present
Graduate Student Researcher — Advisor: Prof. Pratap Tokekar
- Improving object mapping and reconstruction with a mobile robot using Next-Best-View (**NBV**) planning, utilizing deep learning and **Gaussian splats** to predict full models efficiently from partial views without assuming they are centered at the object's center.

Kick Robotics, College Park, MD — Feb 2024 - Present
Computer Vision Engineer Intern
- Developing a autonomous mobile robot to explore and map a warehouse with **RTAB-Map** pipeline using LiDAR, IMU, Depth Camera, Nvidia Jetson, and ROS2 to monitor carbon monoxide levels.

Lighter than Air Systems Lab, Indian Institute of Technology, Bombay — July 2021 - Aug 2022
Robotics Engineer Intern — Advisor: Prof. Rajkumar Pant
- Designed CAD, manufactured and developed firmware for novel and modular UAV docking mechanisms that can lock the UAV in all six degrees of freedom.
- Performed precision landing in ROS gazebo using ARUCO tags and OpenCV to achieve landing accuracy of **+-40cm**.

Projects

SLIC and Image Segmentation Network | *Python, PyTorch, OpenCV*
- Executed superpixel image segmentation with SLIC and k-means algorithms.
- Leveraged **ResNet18** as backbone to create a SLIC superpixel image segmentation network for super pixels achieving **85%** accuracy.

3D Time to Collision using Sensor Fusion | *C++, Eigen, PCL, OpenCV*
- Detected and tracked objects in 3D space from the benchmark KITTI dataset based on camera and lidar measurements.
- Computed time-to-collsion on both camera and lidar sensors by projecting 3d lidar points on to camera sensor.
- Identified the best combination of keypoint detectors and descriptors for object tracking.

Outfit Recommendation System | *Python, OpenCV, PyTorch*
- Enhanced the dataset pipeline with background augmentation and introduced an attention mechanism in the architecture, achieving a 2% increase in Area Under the Curve (AUC) over the baseline, thereby improving the system's robustness to noise in outfit images.

Neural Radiance Fields for View Synthesis (NeRF) | *Python, PyTorch, OpenCV*
- Developed a fundamental implementation of Neural Radiance Fields (**NeRF**) to synthesize novel views of intricate 3D scenes using only a sparse set of input views

Structure from Motion | *Python, OpenCV*
- Reconstructed a 3D scene from a given set of images by feature correspondence with **RANSAC**-based outlier rejection along with triangulation and nonlinear optimization techniques for robust camera pose estimation.

Camera Calibration | *Python, OpenCV*
- Implemented Zhang's camera calibration method which resulted in a mean re-projection error close to **0.5** pixels. Used **SVD** for getting an initial estimate of calibration parameters and Maximum Likelihood Estimation(**MLE**) for optimization.

ARIAC Agility Challenge | *Python,C++, MoveIt, ROS2*
- Used MoveIt motion planning and ROS Services to pick and place bin parts using UR5 robot and submitted orders using AGVs.

Cyber Shopper | *Python, ROS2, MATLAB*
- Executed pick-and-place operations for grocery items utilizing a mobile robot featuring a UR5 arm in ROS2 Gazebo and employed inverse kinematics to ensure precision in robotic manipulation.
- Used Peter Corke's Toolbox in MATLAB to validate forward and inverse kinemtics of the UR5 arm.

Technical Skills

Languages: Python, C, C++, MATLAB
Software Tools: ROS (Robot Operating System), Blender, Git, Docker, CI/CD, Gazebo, Cmake, SolidWorks, Fusion 360, AutoCAD
Libraries: PyTorch, Pandas, Sklearn, NumPy, Matplotlib, OpenCV, open3D
Deep Learning Architectures: VGG16, ResNet, DenseNet, HomographNet, SfMLearner, LSTM, NeRF
